Assignment 0219 Feedback

Andrew Kowalczyk

CSI: OS

3a — Very well done! Your “evidence” exposes pretty much everything, except for one near miss: your Linux kernel screenshot shows files relating to kernel *modules*, but not the kernel itself. Dig around a little bit more to find that. As a smaller note, the “first process” shots are generally right, but you sort of hardcode the expected process ID to 1. Better to just sort the output and pick off the first line—you never know, there might have been a process 0! (not that there is sure to be one; I just wanted to point out the inherent assumption in the commands that you use)

Overall, though, the quality of your work and its very clear presentation are still quite excellent. (+)

System Call Practice

2d — Well done! You are officially a “command line implementer.” :) (+)

4a — All of your code is functional, technically correct, and works as intended. (+)

4b — Not much here with regard to separation of concerns, but nothing egregious either. (|)

4c — No issues with readability here—comments in particular are well-chosen. (+)

Both

4d — Effective resource and information use is readily apparent in your work. (+)

4e — Your commit pacing and messages are excellent. (+)

4f — Submitted on time. (+)
